

# Package ‘csvread’

June 25, 2014

**Title** Fast Specialized CSV File Loader.

**Version** 1.0

**Author** Sergei Izrailev

**Maintainer** Sergei Izrailev <sizrailev@collective.com>

**Description** This package provides functions for loading large (10M+ lines) CSV and other delimited files, similar to read.csv, but typically faster and using less memory than the standard R loader. While not entirely general, it covers many common use cases when the types of columns in the CSV file are known in advance. In addition, the package provides a class 'int64', which represents 64-bit integers exactly when reading from a file. The latter is useful when working with 64-bit integer identifiers exported from databases. The CSV file loader supports common column types including 'integer', 'double', 'string', and 'int64', leaving further type transformations to the user.

**URL** <http://github.com/collectivemedia/csvread>

**Depends** R (>= 3.0.3), methods

**Enhances** bit64

**License** Apache License (== 2.0) | file LICENSE

**Copyright** Copyright (C) Collective, Inc. | file inst/COPYRIGHTS

**LazyData** true

 csvread

*Fast Specialized CSV File Loader.*

---

## Description

Package `csvread` contains a fast specialized CSV and other delimited file loader, and a basic 64-bit integer class to aid in reading 64-bit integer values.

Given a list of the column types, function `csvread` parses the CSV file and returns a data frame.

`map.coltypes` guesses the column types in the CSV file by reading the first `nrows` lines. The result can be passed to `csvread` as the `coltypes` argument.

## Usage

```
csvread(file, coltypes, header, colnames = NULL, nrows = NULL,
        verbose = FALSE, delimiter = ",")
```

```
map.coltypes(file, header, nrows = 100, delimiter = ",")
```

## Arguments

<code>file</code>	Path to the CSV file.
<code>coltypes</code>	<p>A vector of column types, e.g., <code>c("integer", "string")</code>. The accepted types are "integer", "double", "string", "long" and "longhex".</p> <ul style="list-style-type: none"> <li>• <code>integer</code> - the column is parsed into an R integer type (32 bit)</li> <li>• <code>double</code> - the column is parsed into an R double type</li> <li>• <code>string</code> - the column is loaded as character type</li> <li>• <code>long</code> - the column is interpreted as the decimal representation of a 64-bit integer, stored as a double and assigned the <code>int64</code> class.</li> <li>• <code>longhex</code> - the column is interpreted as the hex representation of a 64-bit integer, stored as a double and assigned the <code>int64</code> class with an additional attribute <code>base = 16L</code> that is used for printing.</li> <li>• <code>integer64</code> - same as <code>long</code> but produces a column of class <code>integer64</code>, which should be compatible with package <code>bit64</code> (untested).</li> <li>• <code>verbose</code> - if <code>TRUE</code>, the function prints number of lines counted in the file.</li> <li>• <code>delimiter</code> - a single character delimiter, default is <code>" , "</code>.</li> </ul>
<code>header</code>	<code>TRUE</code> (default) or <code>FALSE</code> ; indicates whether the file has a header and serves as the source of column names if <code>colnames</code> is not provided.
<code>colnames</code>	Optional column names for the resulting data frame. Overrides the header, if header is present. If <code>NULL</code> , then the column names are taken from the header, or, if there is no header, the column names are set to <code>'COL1'</code> , <code>'COL2'</code> , etc.
<code>nrows</code>	If <code>NULL</code> , the function first counts the lines in the file. This step can be avoided if the number of lines is known by providing a value to <code>nrows</code> . On the other hand, <code>nrows</code> can be used to read only the first lines of the CSV file.
<code>verbose</code>	If <code>TRUE</code> and <code>nrows</code> is <code>NULL</code> , the function prints number of lines counted in the file.
<code>delimiter</code>	A single character delimiter, default is <code>" , "</code> .

## Details

csvread provides functionality for loading large (10M+ lines) CSV and other delimited files, similar to read.csv, but typically faster and using less memory than the standard R loader. While not entirely general, it covers many common use cases when the types of columns in the CSV file are known in advance. In addition, the package provides a class 'int64', which represents 64-bit integers exactly when reading from a file. The latter is useful when working with 64-bit integer identifiers exported from databases. The CSV file loader supports common column types including integer, double, string, and int64, leaving further type transformations to the user.

If number of columns, which is inferred from the number of provided coltypes, is greater than the actual number of columns, the extra columns are still created. If the number of columns is less than the actual number of columns in the file, the extra columns in the file are ignored. Commas included in double quotes will be considered part of the field, rather than a separator, but double quotes will NOT be stripped. Runaway double quotes will end at the end of the line.

See also [int64](#) for information about dealing with 64-bit integers when loading data from CSV files.

## Value

A data frame containing the data from the CSV file.

---

int64

*A very basic 64-bit integer class.*

---

## Description

A very basic 64-bit integer class.

## Usage

```

int64(length = 0)

is.int64(x)

## Default S3 method:
as.int64(x, ...)

## S3 method for class 'factor'
as.int64(x, ...)

## S3 method for class 'character'
as.int64(x, base = 10L, ...)

## S3 method for class 'numeric'
as.int64(x, ...)

## S3 method for class 'NULL'
as.int64(x, ...)

## S3 method for class 'int64'
format(x, ...)

## S3 method for class 'int64'
print(x, ...)

```

```
## S3 method for class 'int64'
as.character(x, base = NULL, ...)

## S3 method for class 'int64'
as.double(x, ...)

## S3 method for class 'int64'
as.integer(x, ...)

## S3 method for class 'int64'
is.na(x, ...)

## S3 method for class 'int64'
as.data.frame(x, ...)

## S3 method for class 'int64'
as.list(x, ...)

## S3 method for class 'int64'
c(...)

## S3 method for class 'int64'
is.numeric(x)
```

### Arguments

<code>x</code>	Object to be coerced or tested
<code>length</code>	A non-negative integer specifying the desired length. Double values will be coerced to integer: supplying an argument of length other than one is an error.
<code>...</code>	Further arguments passed to or from other methods.
<code>base</code>	Specifies the base of the number (default is the base attribute of the object).

### Details

The `int64` class stores 64-bit integers in vectors of doubles and the base as an attribute `base` of the vector for printing and conversion to character. The motivation behind this class is to give R the ability to load 64-bit integers directly, for example, to represent the commonly used 64-bit identifiers in relational and other databases.

`Ops.int64`

*Operators for the `int64` class.*

---

### Description

Operators for the `int64` class: one of `+`, `-`, `==`, `!=`, `<`, `<=`, `>` or `>=`.

**Usage**

```
e1 + e2
e1 - e2

## S3 method for class 'int64'
e1 + e2

## S3 method for class 'int64'
e1 - e2
```

**Arguments**

e1	int64 object, character vector or numeric vector (character and numeric values are converted by <code>as.int64</code> ).
e2	int64 object, character vector or numeric vector (character and numeric values are converted by <code>as.int64</code> ).
